does the resistance loss. Electrical resistance converts electric power into thermal energy, which is lost to the atmosphere. At least through the 1980s, utility engineers in the Midwest estimated the power lost through transmission and distribution at 7% of the power leaving the generating station (the bus bar power output).

A power plant produces electrical energy in medium (20 000 V) or low (1 000 V) voltage which is then elevated to high voltage (up to 400 kV) by a step-up substation. Electrical power is then transmitted across long distances by high-tension power lines, and the higher the voltage, the more power can be transmitted.
